(54) REGIONAL INFORMATION INTEGRATION SYSTEM

(57)Abstract:

PROBLEM TO BE SOLVED: To enable a user to obtain required regional information at once by a simple procedure and to browse a plurality of map data whose data types and scales are different in an automatically combined state.

SOLUTION: When a reception part 11 receives a prescribed retrieval keyword inputted to a terminal computer 2, a control program 13 of a server computer 1 extracts the regional information of the same region to which the same retrieval keyword is set respectively from various kinds of data bases 3, 4, 5 and 6, respectively enlarges, reduces, overlaps and combines all graphic data included in various kinds of the extracted regional information so as to match an orientation point by a graphic data synthesis program 7, then makes them three-dimensional by a program 8 for making the graphic data

three- dimensional, then links attribute data included in the extracted regional information, integrates the regional information, buries it in a Web page 10 and transmits it from a transmission part 12 to the terminal computer 2.
